38th (EWGLAM) and 23rd (SRNWP) EUMETNET meetings
Rome, 2-6 Oct. 2016

Why?

Significant gaps in the polar observing systems

Hard task for data assimilation where (i) observations are rare

Synop, AIREP, DRIBU, TEMP and PILOT

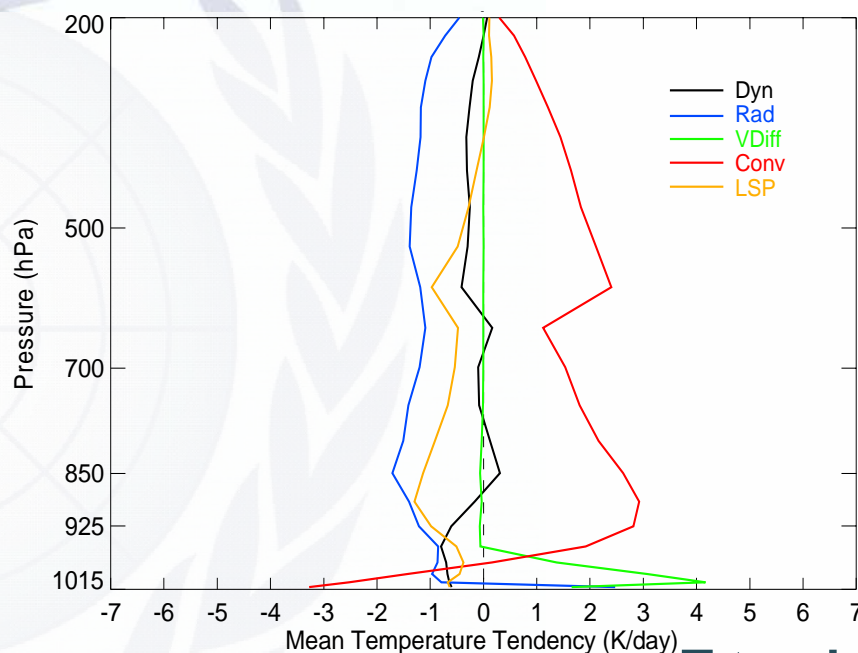

Polar data coverage of conventional observations in the ECMWF operational analysis
on 1 January 2012

Why?

Hard task for data assimilation where (i) observations are rare
and (ii) models are deficient

Strong differences between polar and lower latitudes

Tropics: Ocean-only (DJF)

Arctic: Sea ice-covered ocean (DJF)

T-tendencies:

dynamical cooling by advection and ascent (Dyn); radiative (Rad);
vertical diffusion (VDiff); convective (Conv);
evaporative cooling of large-scale precipitation (LSP);

S. Serrar (AWI)

Model difficulties:

- stably stratified boundary layers over sea ice
- mixed-phase clouds
- presence of sea-ice; difficult rheology

Why?

Analysis and forecast quality

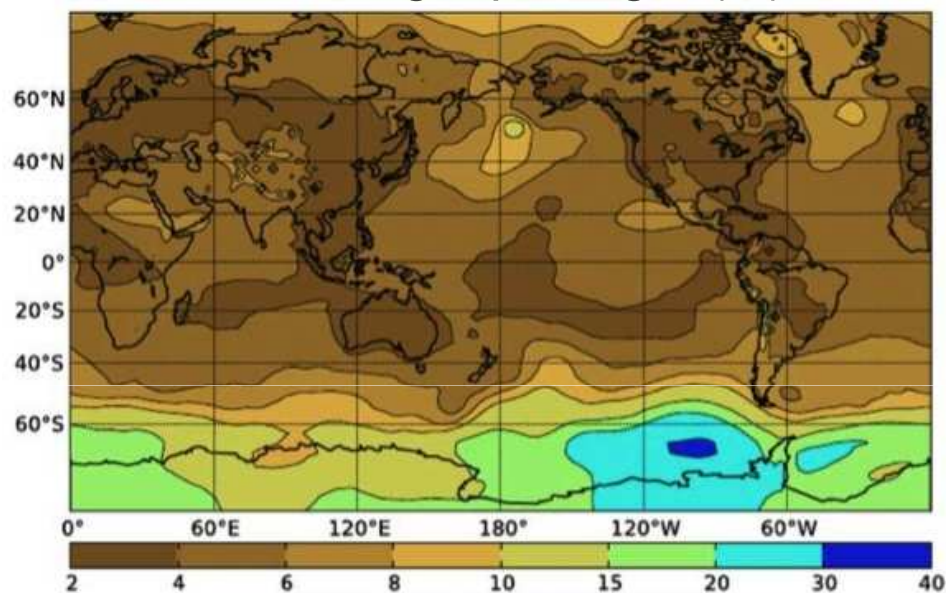

TIGGE* analysis spread (Oct-Nov 2010)

* UKMO, ECMWF, NCEP, CMC, CMA

2-meter temperature (K)

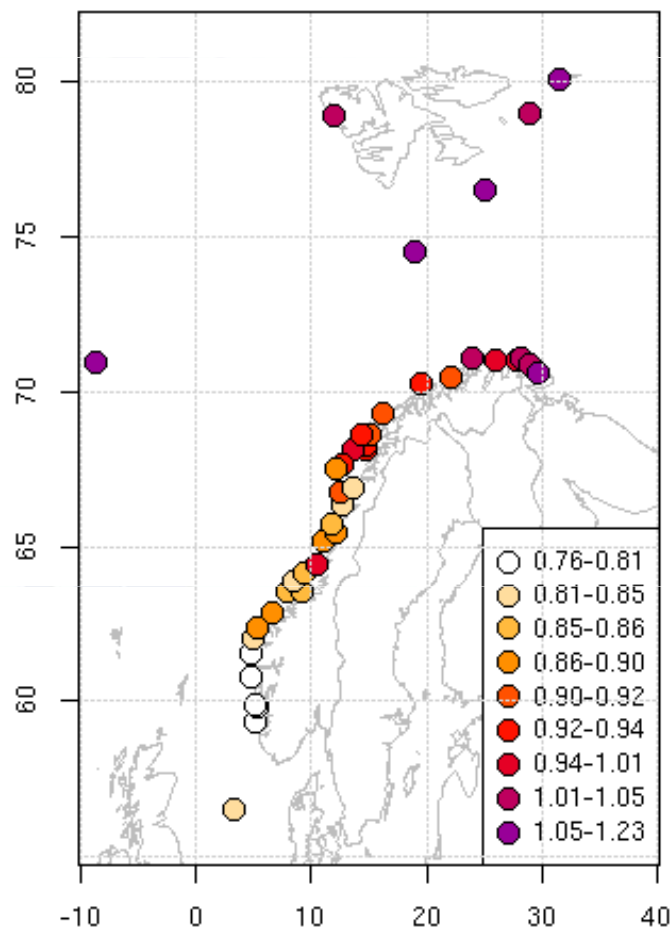

500hPa geopotential height (m)

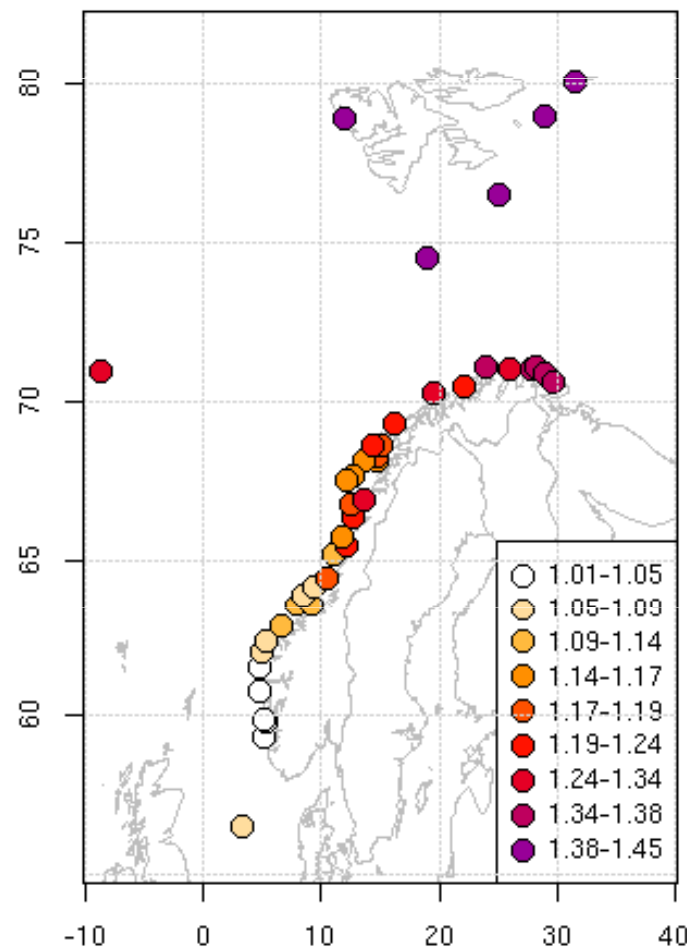

Forecast accuracy decreases towards the North

RMS errors in pressure (vs observations) for forecasts from 18 to 42 hours

Operational ECMWF
global model

Operational HIRLAM
regional model

The YOPP-Observational Component

Year of Polar Prediction

Special Observing Periods (SOPs)

Final approval pending (27 Sep 2016)

The YOPP Modeling Component

- Identify polar specific scientific issues that require addressing in NWP systems to advance predictive skill
- Devise numerical experiments that provide guidance on how to implement improvements

How do we diagnose/quantify this?

Model forecasts:

- Observation impact: contribution of observations to predictive skill (FSOI, OSE, OSSE)
- Ensemble diagnostics: sensitivity of forecasts to location/magnitude of initial perturbations
- Relaxation experiments: sensitivity of forecasts to 'accurate' states in selected areas, linkages

Analysis/initial conditions:

- Observation impact: contribution of observations to analysis (DFS, increments)
 - Ensemble diagnostics: consistency of uncertainty definition in analysis
- Tendency diagnostics: contribution of processes to tendencies, error growth
 - Reanalyses: representation of trends, budgets (incl. most of the above!)

NB: Climate change may hamper statistical calibration of extremes

YOPP Model Dataset Categories

Core Datasets:

Main modelling datasets produced primarily to support YOPP. Covering YOPP core period (mid-2017 to mid-2019) but could be extended to cover MOSAiC period

Supplementary Datasets:

Outside YOPP, but providing valuable resources to support YOPP scientific studies.

Experimental Datasets:

Experiments running during YOPP aimed at studying and improving model performance for polar prediction. This will include contributions from a wide range of YOPP scientists.

Example: Analysis Uncertainty

T2m mean analysis spread (OCT 2006–NOV 2013)

CMC, ECMWF, JMA, NCEP and UKMO

(a)DJF

(b)MAM

(c)JJA

(d)SON

Large spread in the analysis of T2m in regions of sea ice and snow
– **except summer** when the ice temperature is close to melting.

Jung et al. 2014

Forecast sensitivity to the observing system within the Arctic (>68N) –Winter (S. Keeley, ECMWF)

Adjoint sensitivity tool (FSOI = Forecast Sensitivity to Observations Impact)

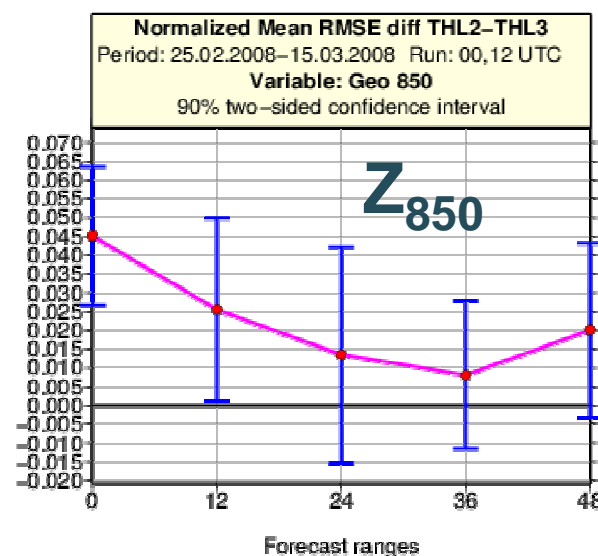

41r1 for 1st November 2015 – 28 February 2016

Examples from short-range NWP:

OSE – Impact of remote radiosonde stations

IPY-THORPEX study (March 2008) Randriamampianina et al. (2011)

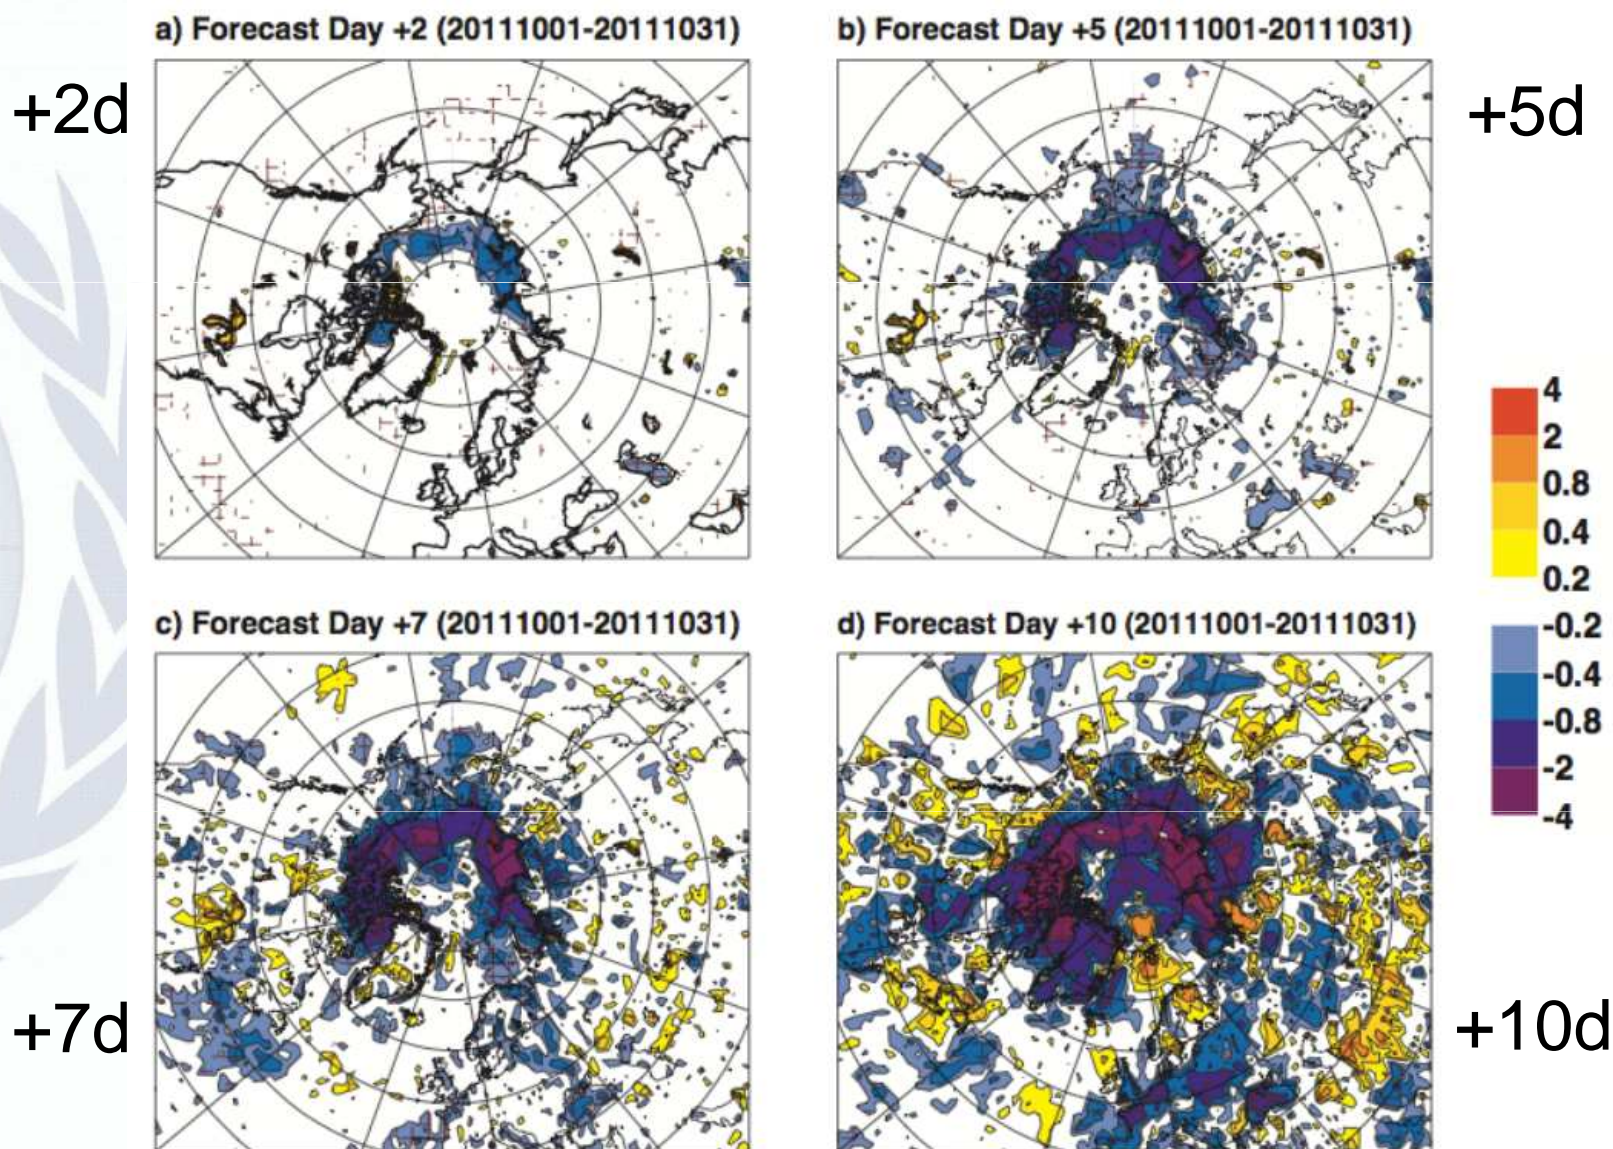

OSSE – impact of more ~24 (x2) BUOYs

EU FP7 ACCESS study (August 2013) Randriamampianina & Schyberg (2014)

Example: Relaxation experiments

Atmosphere model coupled with observed SSTs

- A small-scale, rapidly developing and fairly intense cyclone over ice-free ocean
- October - May
- Rapidly changing weather
- Gale or storm force winds
- Severe snow intensity

Polar lows:

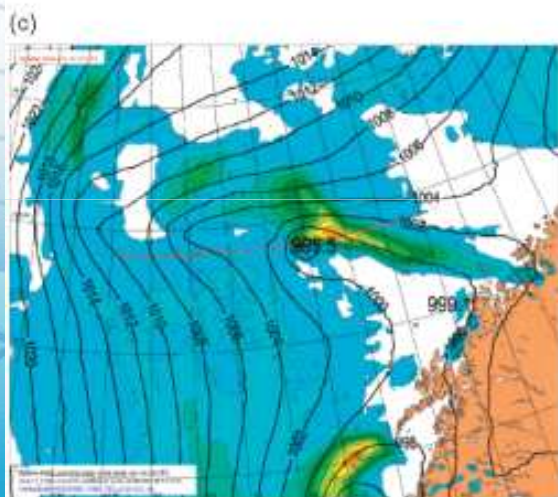

Example from IPY Thorpex

Randriamampianina, Iversen and Storto **2011, Q.J.R.M.S.** DOI:10.1002/qj.838

24h forecast, valid at 16.03.2008 12 UTC

IASI-data

No IASI-data

20080316 12 UTC

HARMONIE verifying analysis
16.03.2008 12 UTC

IASI & campaign data employed

Campaign observations + IASI → improved forecast

NOAA-18, 16.03.2008 09:26

Operational short-range NWP with Arctic cover

Multi-model, pan-European EPS ~8 km resolution
Forecast range: 54h 48 +4 ensemble members
Four times a day (00, 06, 12 and 18 UTC)

AROME-Arctic

Categorical (deterministic) 60h
convective scale (2.5km) atmosphere model
coupled to simplified sea-ice model

Also a candidate for re-analysis

Other European Systems are welcome!

Possible (Nordic) short-range contributions to the YOPP modelling plan:

- **Core datasets**

- AROME-Arctic forecast data sets with additional variables
- Re-analysis with AROME-Arctic

- **Supplementary datasets**

- GLAMEPS forecast data

- **Experimental Set-ups**

- Data-denial experiments with AROME-Arctic
- Experiments with GLAMEPS (possibly)
- High-resolution coupled model system experiments

NB: To obtain YOPP endorsement of projects
→ <http://apps3.awi.de/YPP/>

Arctic-specific phenomena can be relevant for NWP at mid-latitudes, e.g.:

- Stable ABL,
- Fog & Stratus-clouds;
- Mesoscale storm systems (Mediterranean «hurricanes»)
- Weather systems associated with strong surface contrasts
- Linkages:

Extra-tropical influence on Arctic predictability

Arctic influence on extra-tropical predictability

Should SRNWP address potential C.C.-induced NWP-challenges?

Climate Change: Profoundly new extremes (?)

Kolstad and Bracegirdle, 2007, Clim Dyn:

Where do we find polar lows today?

Red: Marine cold air outbreaks => polar lows

Polar Lows in the Future

Blue: Fewer polar lows than now

Red: More numerous polar lows than now

Note increase in the Barents Sea

Predicting extremes in the Arctic Extreme Forecast Index (EFI) for T2m; 30 Dec. 2015

L. Magnusson; E C M W F

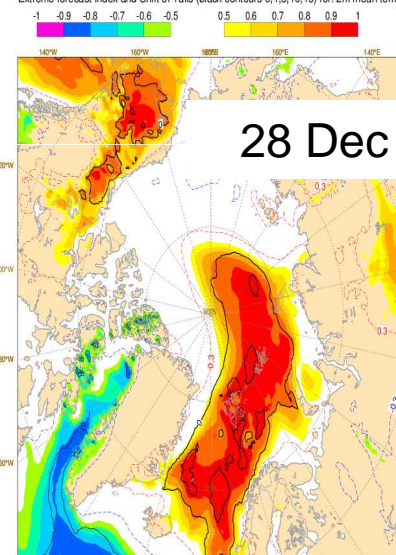

Wed 30 Dec 2015 00UTC @ECMWF VT: Wed 30 Dec 2015 00UTC - Thu 31 Dec 2015 00UTC 0
Extreme forecast index and Shift of Tails (black contours 0, 1, 5, 10, 15) for: 2m mean temperature

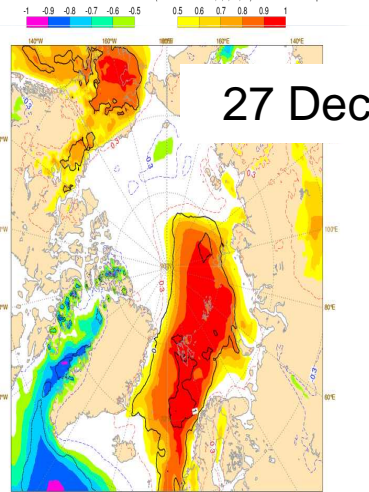

Tue 29 Dec 2015 00UTC @ECMWF VT: Wed 30 Dec 2015 00UTC - Thu 31 Dec 2015 00UTC 24-48h
Extreme forecast index and Shift of Tails (black contours 0, 1, 5, 10, 15) for: 2m mean temperature

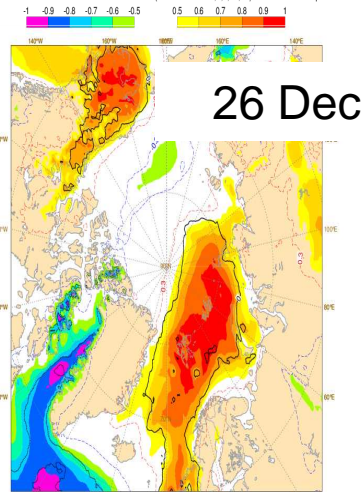

Mon 28 Dec 2015 00UTC @ECMWF VT: Wed 30 Dec 2015 00UTC - Thu 31 Dec 2015 00UTC 48-72h
Extreme forecast index and Shift of Tails (black contours 0, 1, 5, 10, 15) for: 2m mean temperature

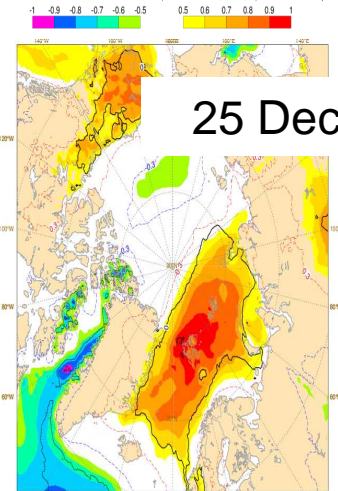

Sun 27 Dec 2015 00UTC @ECMWF VT: Wed 30 Dec 2015 00UTC - Thu 31 Dec 2015 00UTC 72-96h
Extreme forecast index and Shift of Tails (black contours 0, 1, 5, 10, 15) for: 2m mean temperature

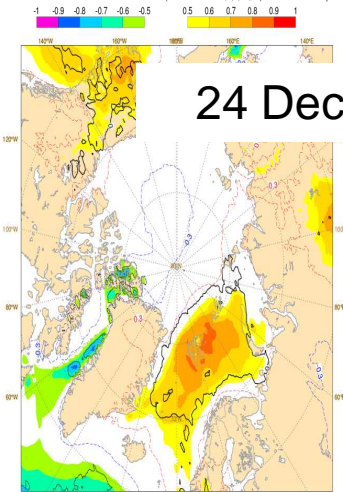

Sat 26 Dec 2015 00UTC @ECMWF VT: Wed 30 Dec 2015 00UTC - Thu 31 Dec 2015 00UTC 96-120h
Extreme forecast index and Shift of Tails (black contours 0, 1, 5, 10, 15) for: 2m mean temperature

Fri 25 Dec 2015 00UTC @ECMWF VT: Wed 30 Dec 2015 00UTC - Thu 31 Dec 2015 00UTC 120-144h
Extreme forecast index and Shift of Tails (black contours 0, 1, 5, 10, 15) for: 2m mean temperature

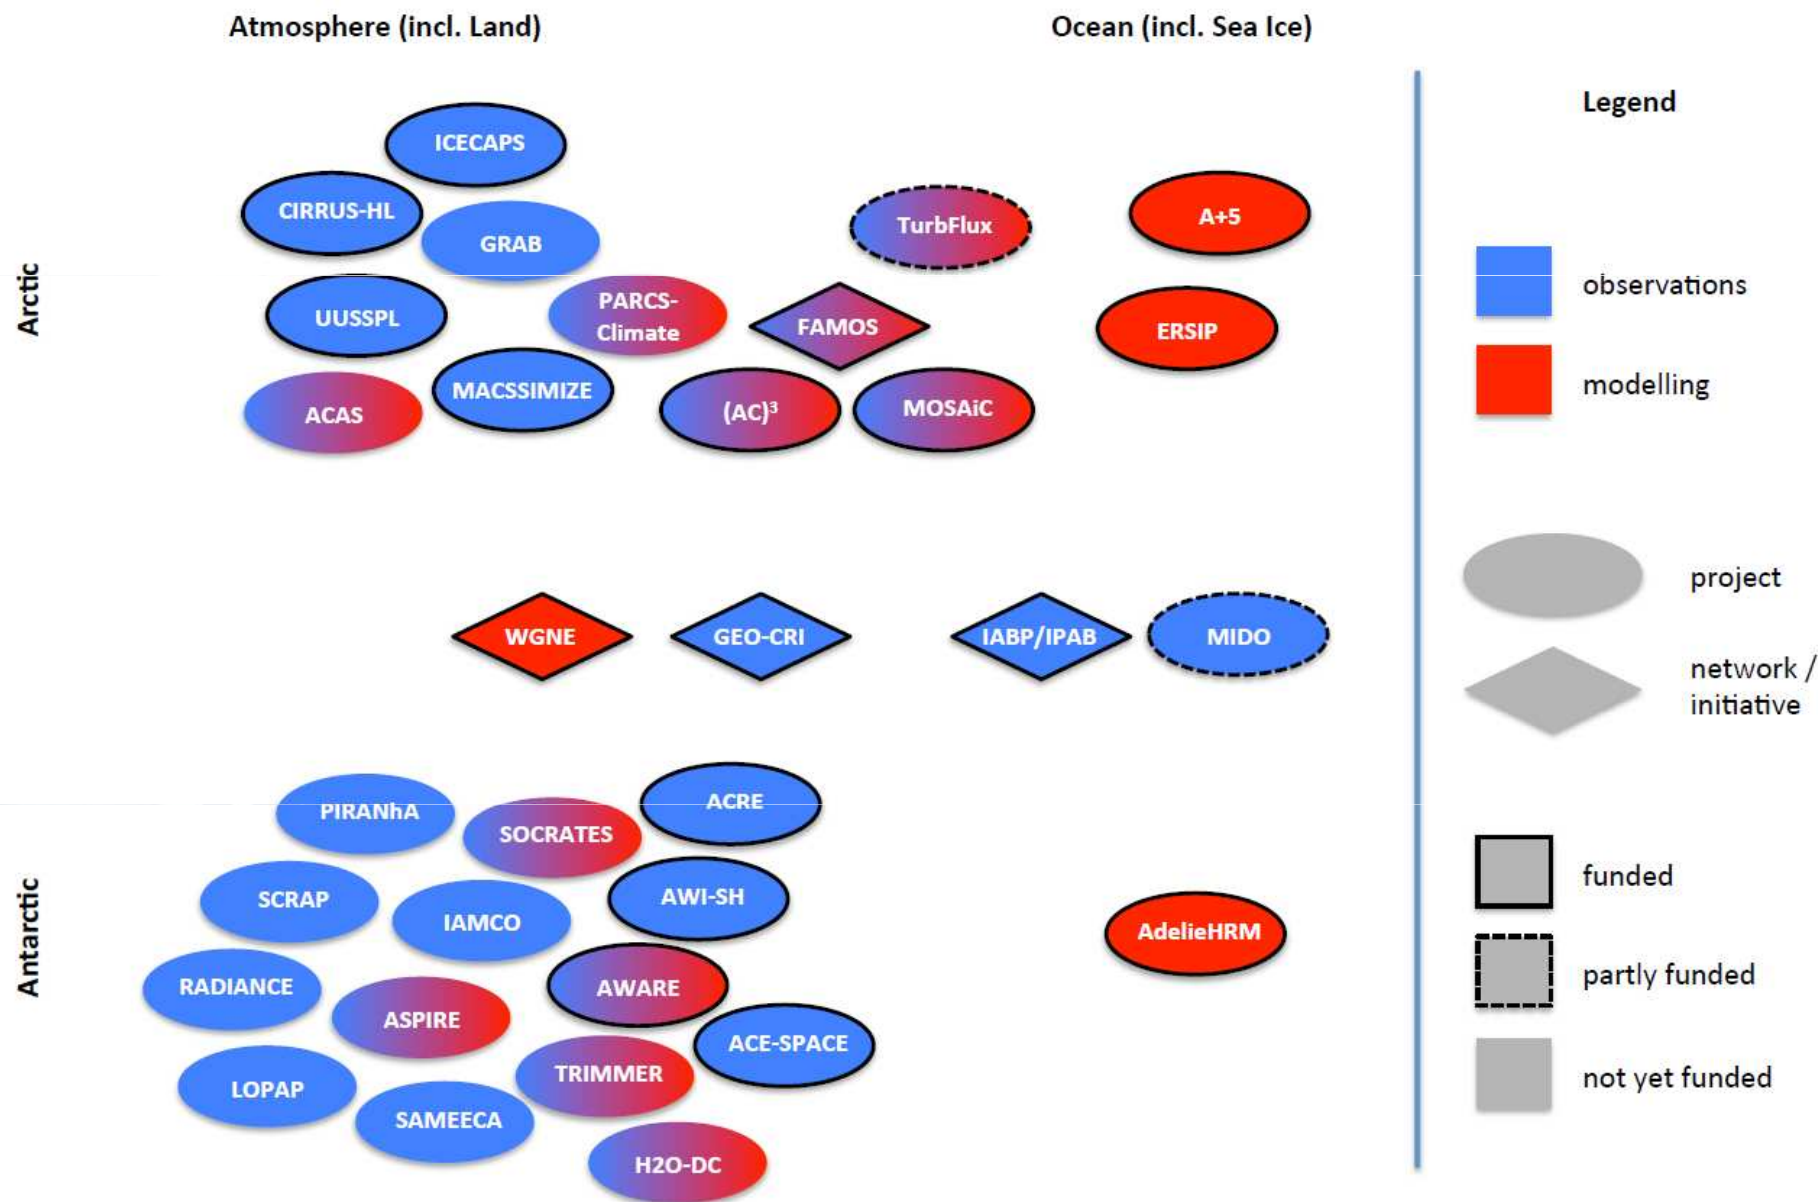

Thu 24 Dec 2015 00UTC @ECMWF VT: Wed 30 Dec 2015 00UTC - Thu 31 Dec 2015 00UTC 144-168h
Extreme forecast index and Shift of Tails (black contours 0, 1, 5, 10, 15) for: 2m mean temperature

YOPP-endorsed projects & initiatives

state 27 September 2016

→ <http://apps3.awi.de/YPP/>

Føre et al, 2011, (IPY Thorpex) QJRMS

16:01 UTC on 3 March

Pot Temp

Rel Hum

Wind

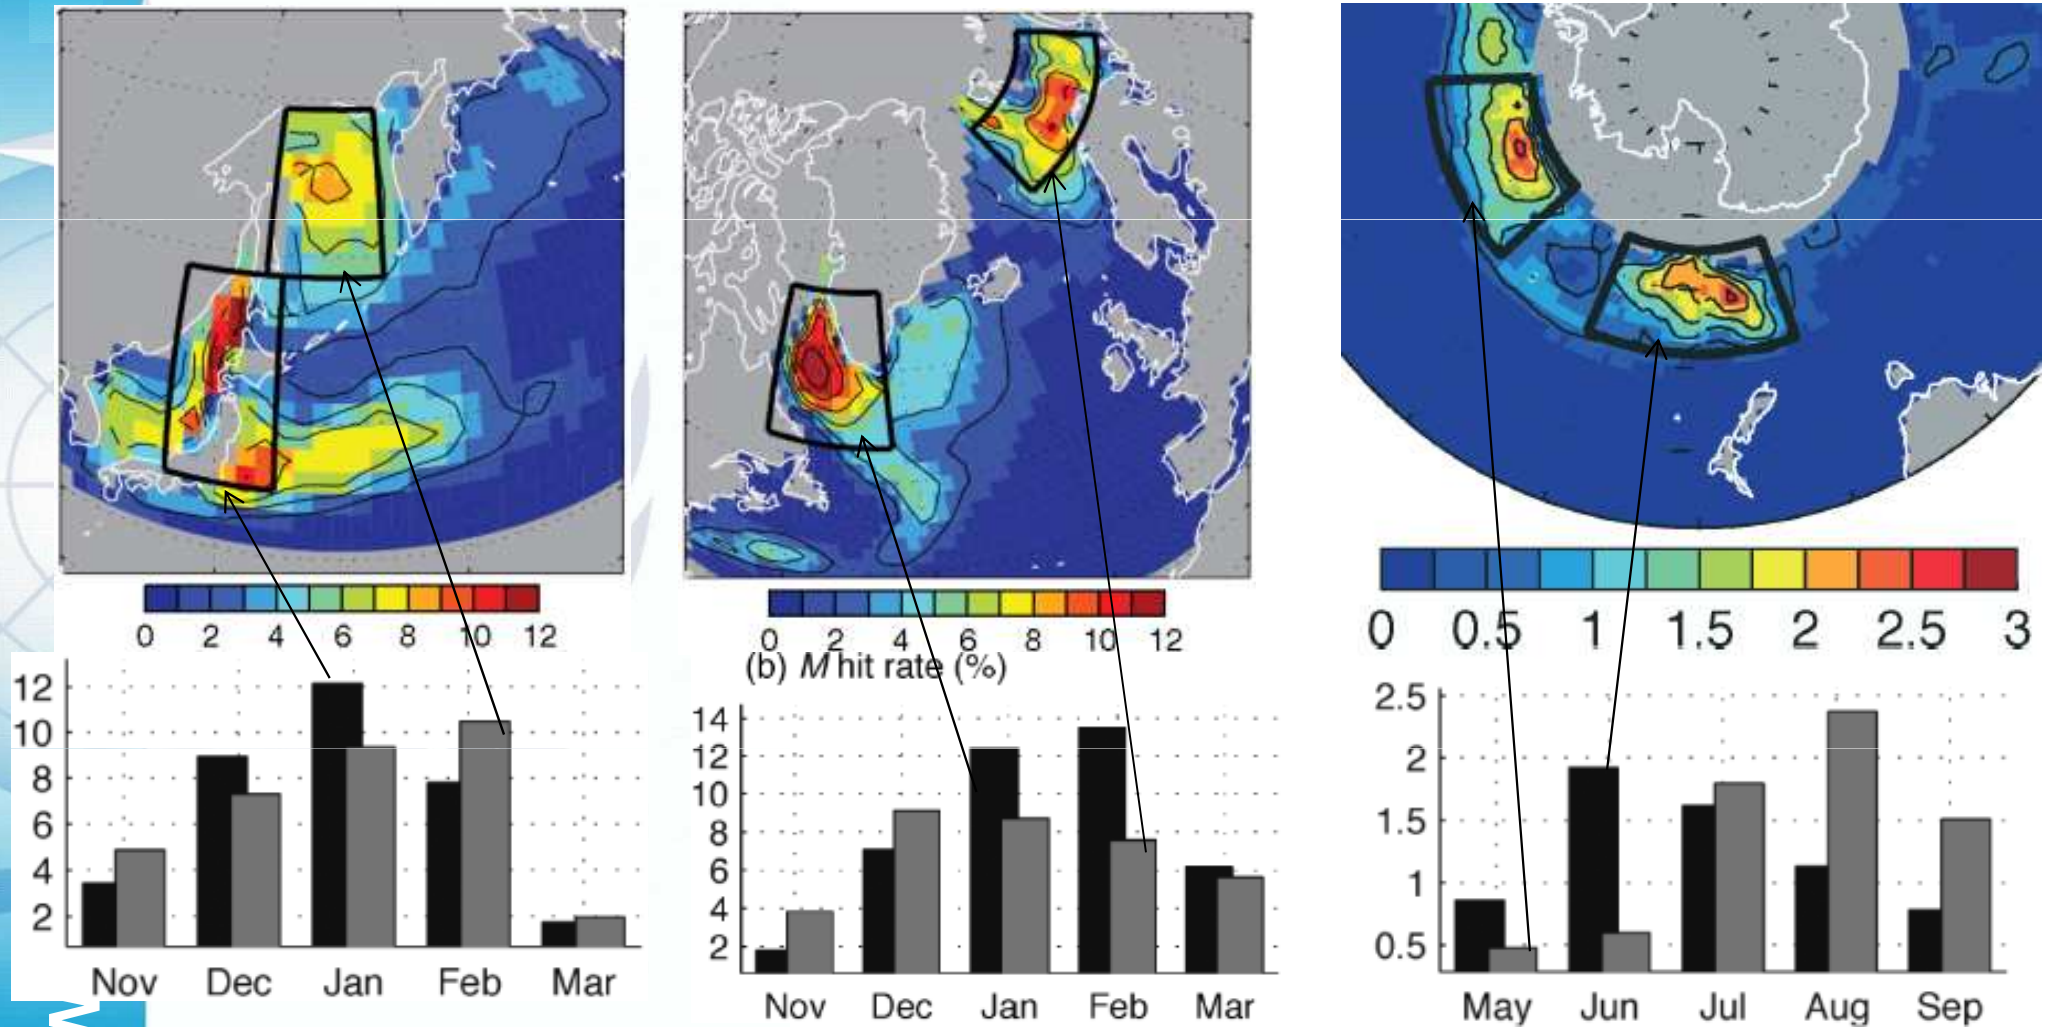

11:28 UTC on 4 March

MCAO ($M > 3.4$)-Hit Rate 1989-2010, ERA Interim

$$M = \frac{L}{Z} (\ln \theta_s - \ln \theta_{700})$$

$$L = 7 \times 10^5 \text{ m}$$

Additional requirements are needed for PLs to actually occur:
 E.g.: upper-level PV anomaly: $p_{2pvu} > 470 \text{ hPa}$

The YOPP-Observational Component

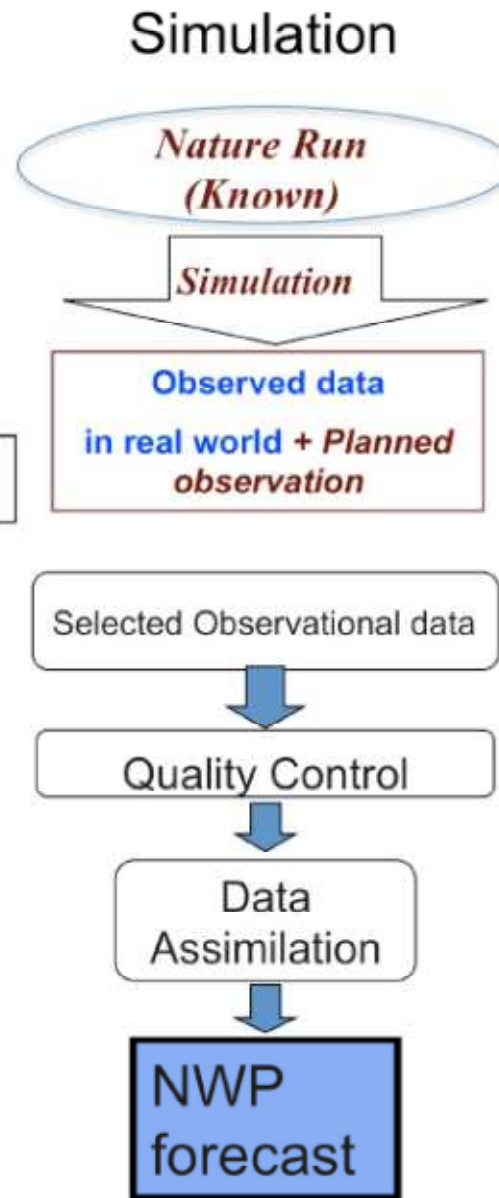

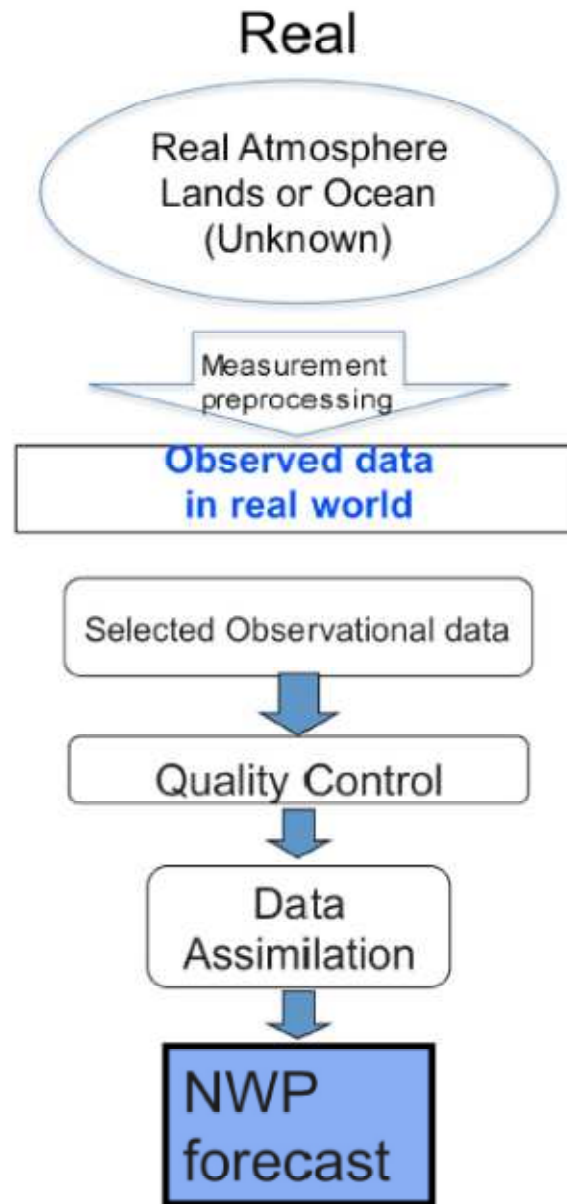

- Purpose: Comprehensive observational „snapshot“ for
 - Improved initial conditions
 - Model development
 - Forecast verification
- Selected Elements
 - Mobile systems (buoys, ships etc.) → SOPs
 - Extra observations from existing sites → SOPs
 - Supersites → model grid box (e.g., MOSAiC and SIOS)
 - Satellite snapshots
 - YOPP field campaigns (aircraft etc.)
 - User relevant data → verification
 - Data availability (GTS, data sharing)

Example for experiments: OSE and OSSE

What: quantify improvement of analysis/forecast contributed by (simulated) observations

How: perform experiments with existing and simulated observations (needs calibration)

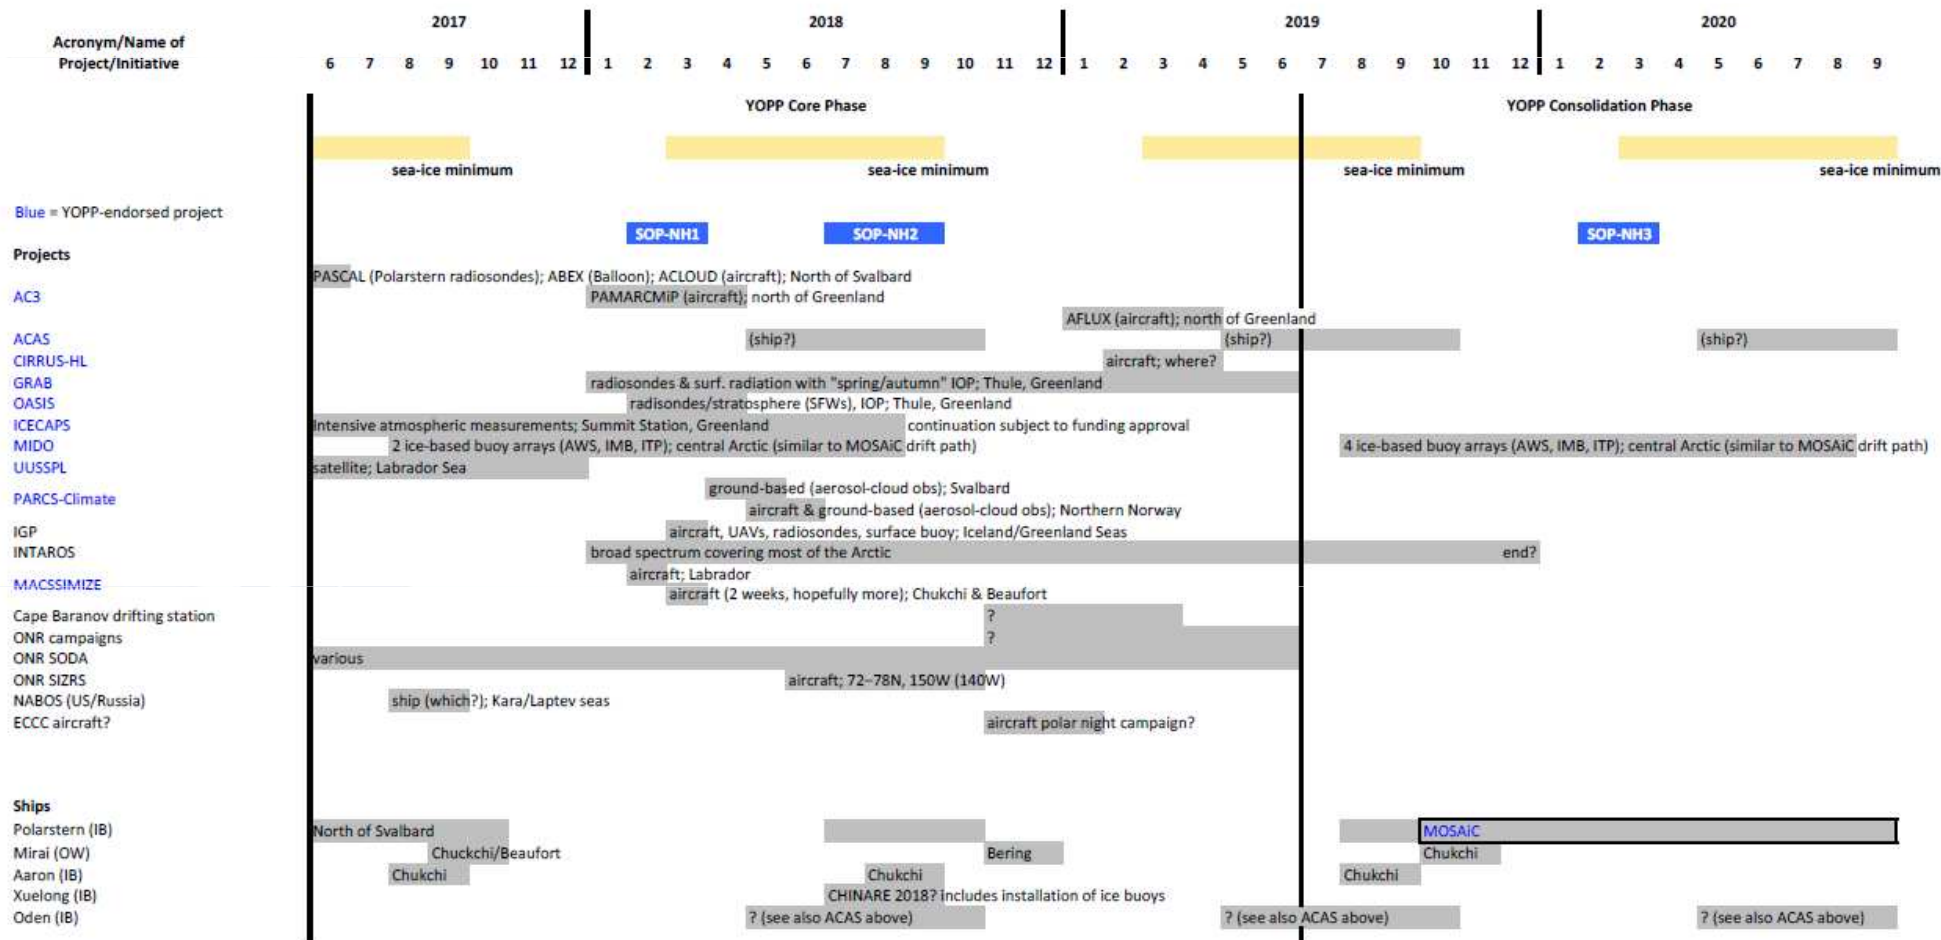

OSE
Data denial experiments using real observation

OSSE
Data denial and *adding* experiments with simulated observation
Truth is available for verification.

YOPP Arctic Observations – Timelines

state 27 September 2016

Growth mechanism: consequence of ABL contrasts specific for the Arctic

Linders and Sætra, 2010, J.A.S.

$t_{\text{CAPE}} < 1\text{h}$; $t_{\text{PL}} \sim > 1\text{d}$
There is no CAPE-reservoir for PL kinetic energy.

Plausible energy source:
Continuously replenished
turbulent surface fluxes

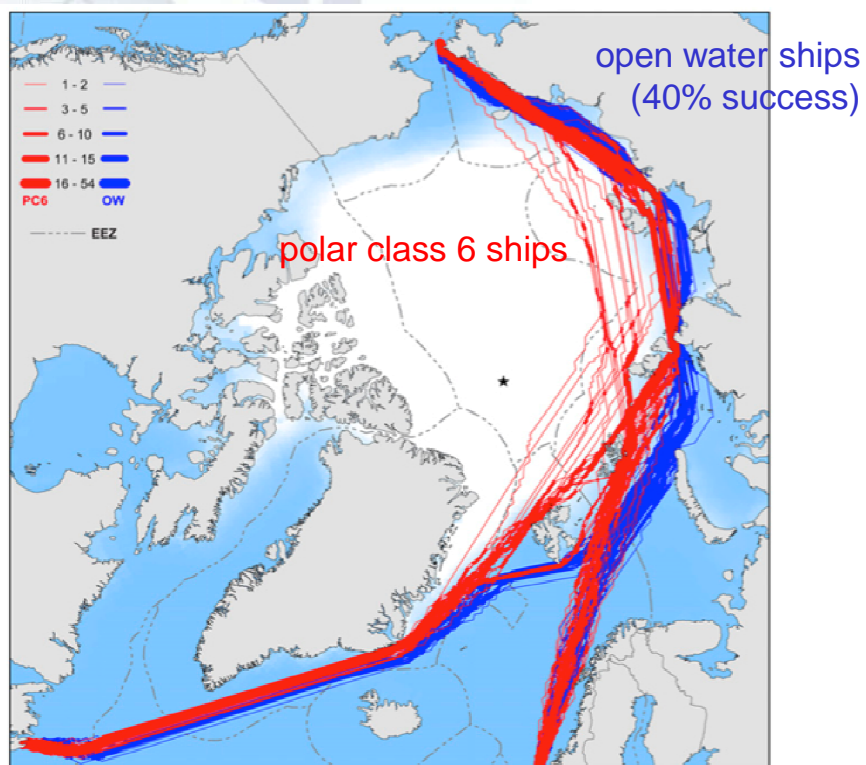

High CIN \rightarrow Low CAPE
Stably capped, unstable ABL,
i.e. during cold air outbreaks

Why?

Climate change: Arctic opening and increased activity

Optimal Arctic shipping routes

1979-2005

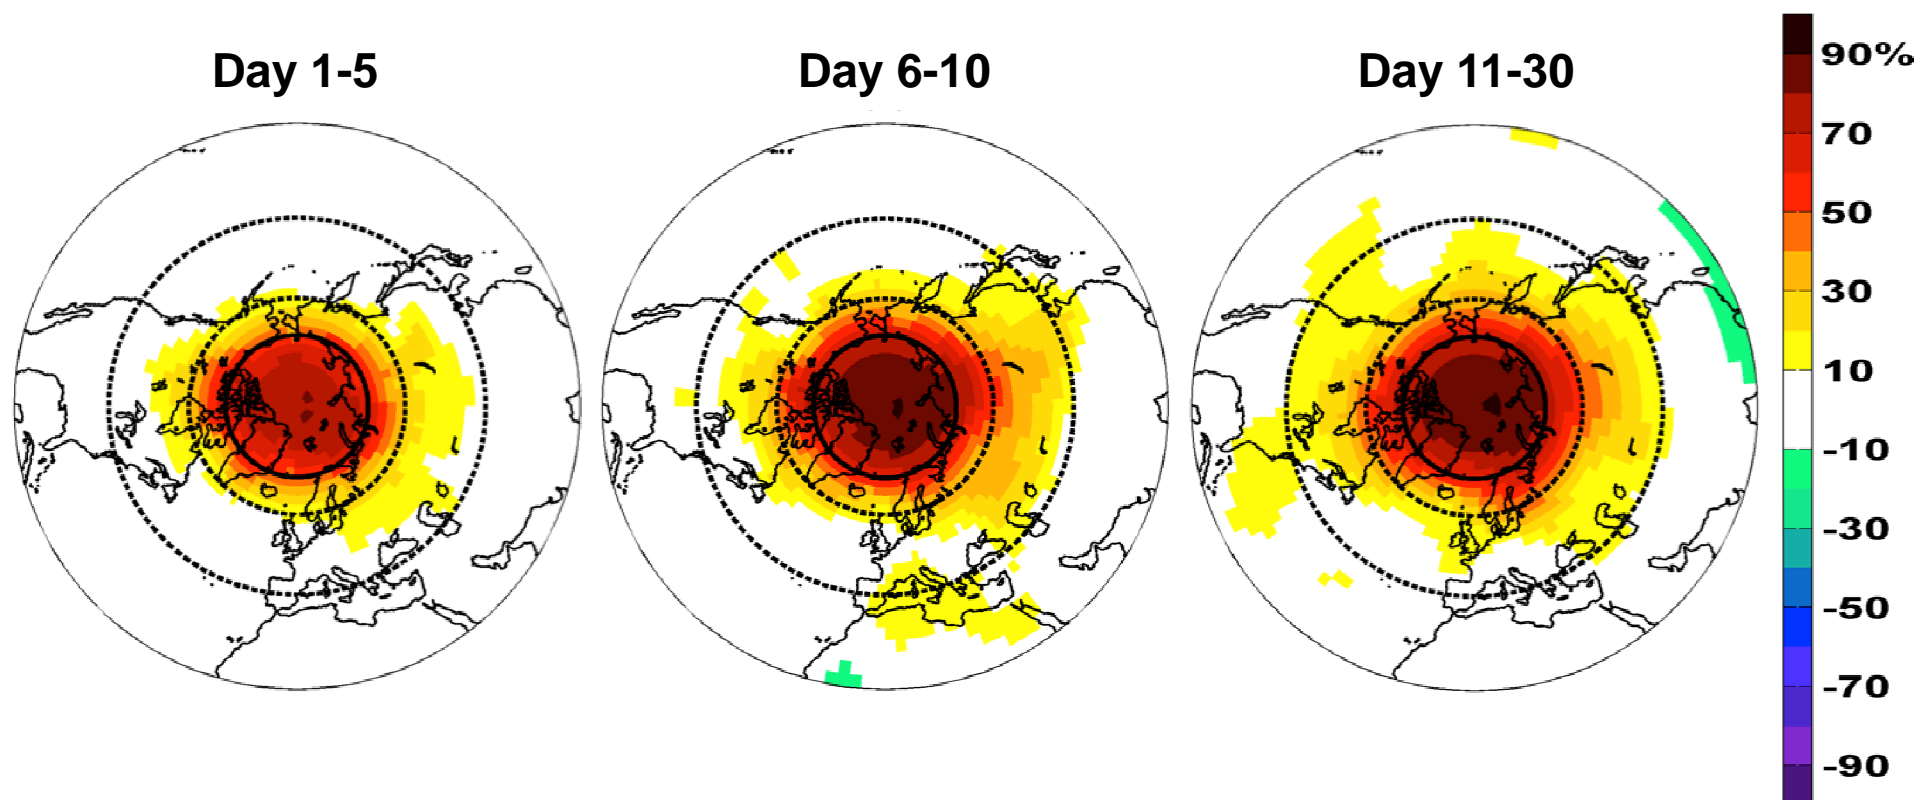

2040-2059 (RCP 4.5)

Why?

Linkages: Potential for improved predictions
in middle latitudes

Jung et al. (2014), Geophys. Res. Lett.
