

Implementation of a Mire parameterization in TERRA

- Experiments with COSMO-D2

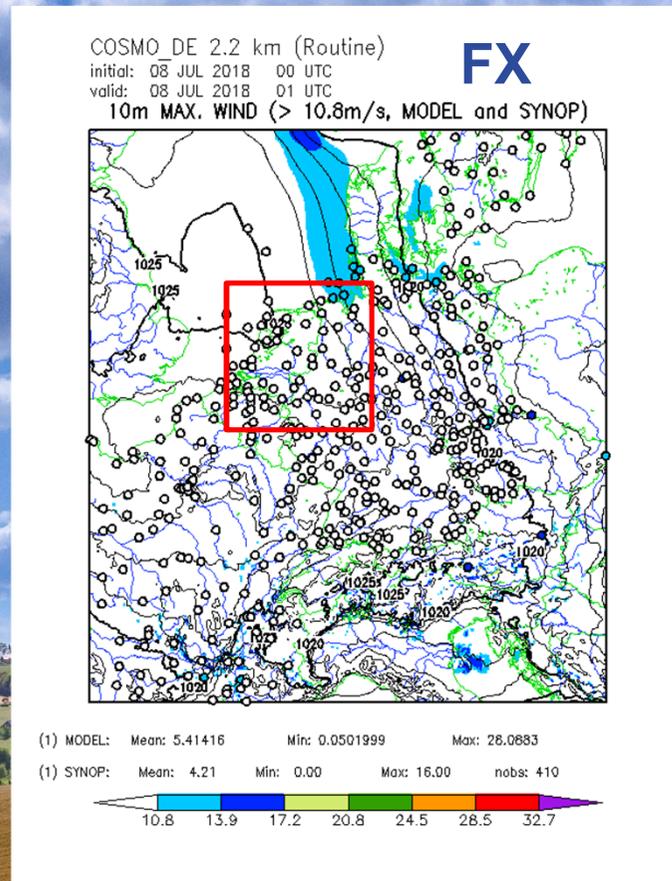

Jürgen Helmert, A. Yurova, I. Rozinkina, J.M. Bettems, M. Baldauf, K. Stephan,
U. Schättler, D. Mironov, G. Zängl

Summer 2018

- Very warm
- Very dry
- In principle good conditions for ballon rides...

Guidance from COSMO-D2 too gusty ...
Problem for ballon rides and forecasters of national service

View from Skreiabanen towards Lensbygda at Toten - Wikipedia

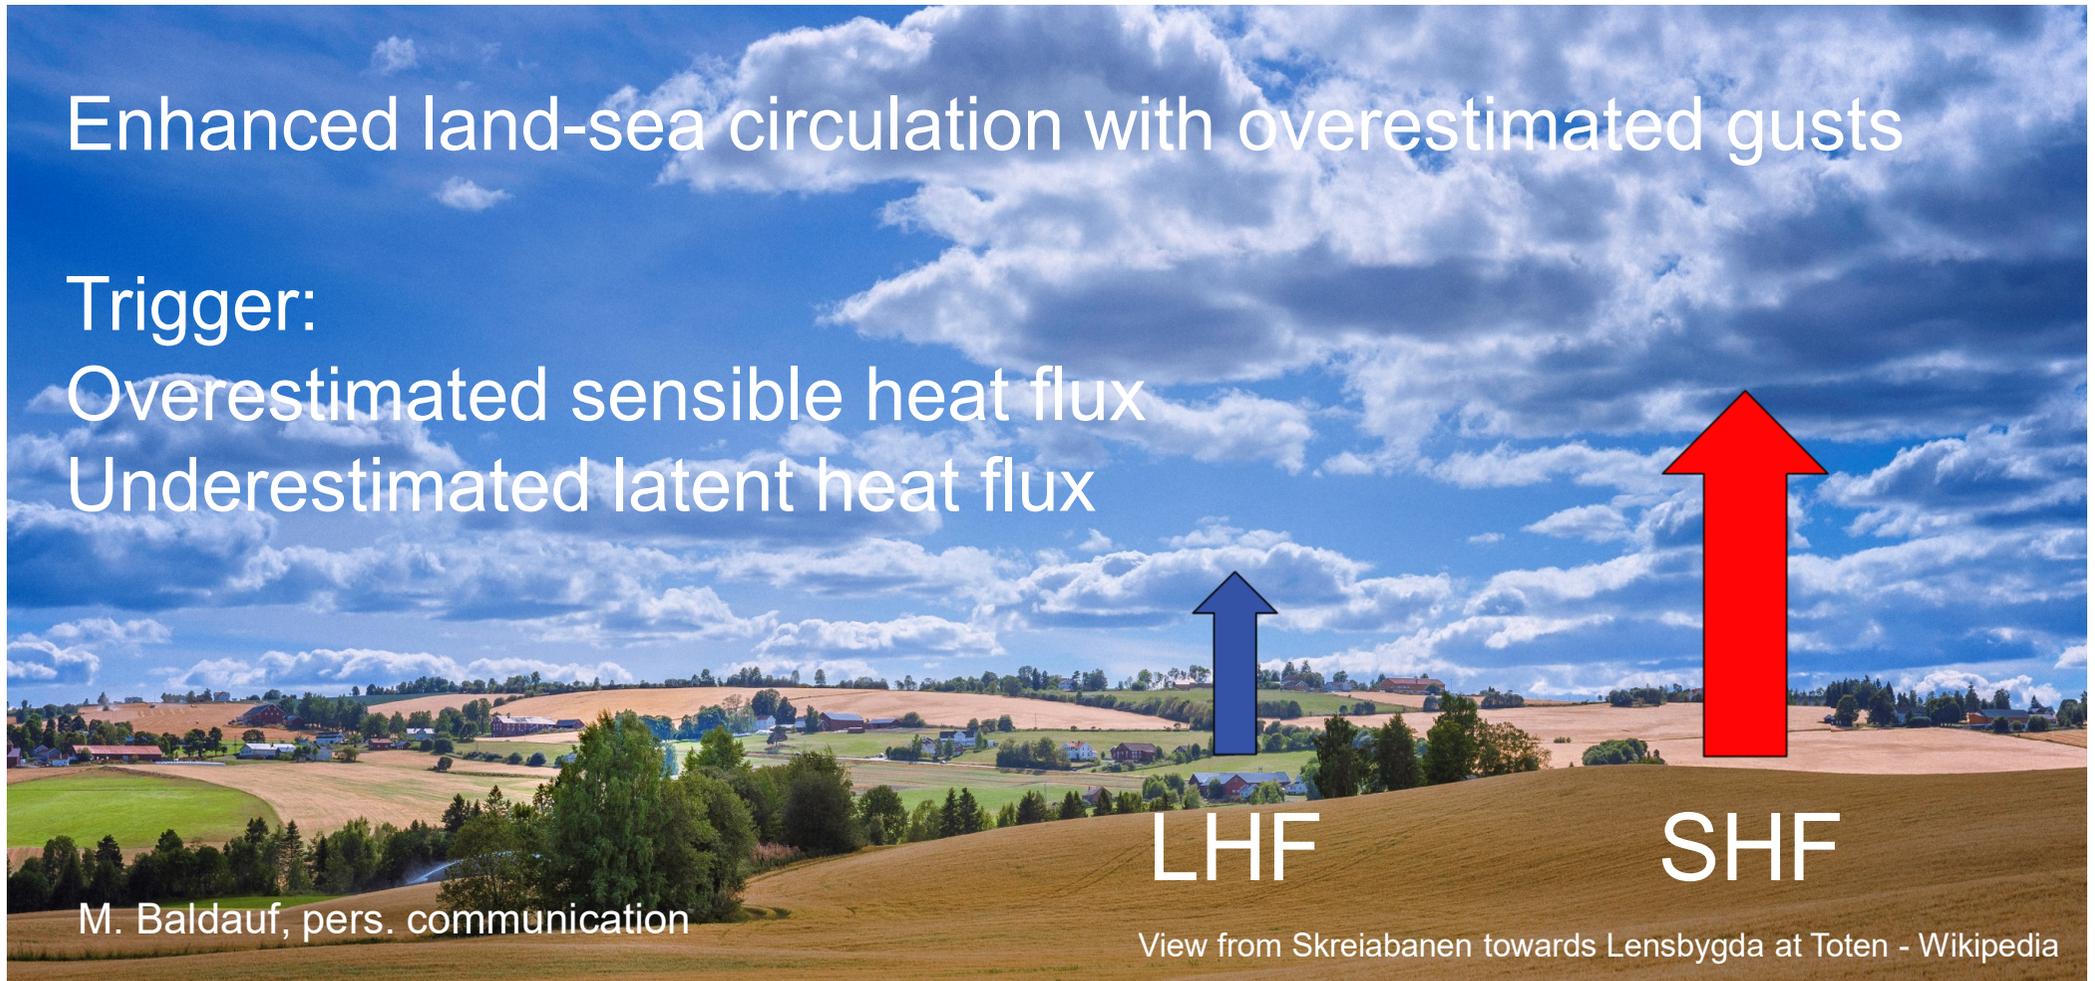

COSMO-D2 physical processes

Enhanced land-sea circulation with overestimated gusts

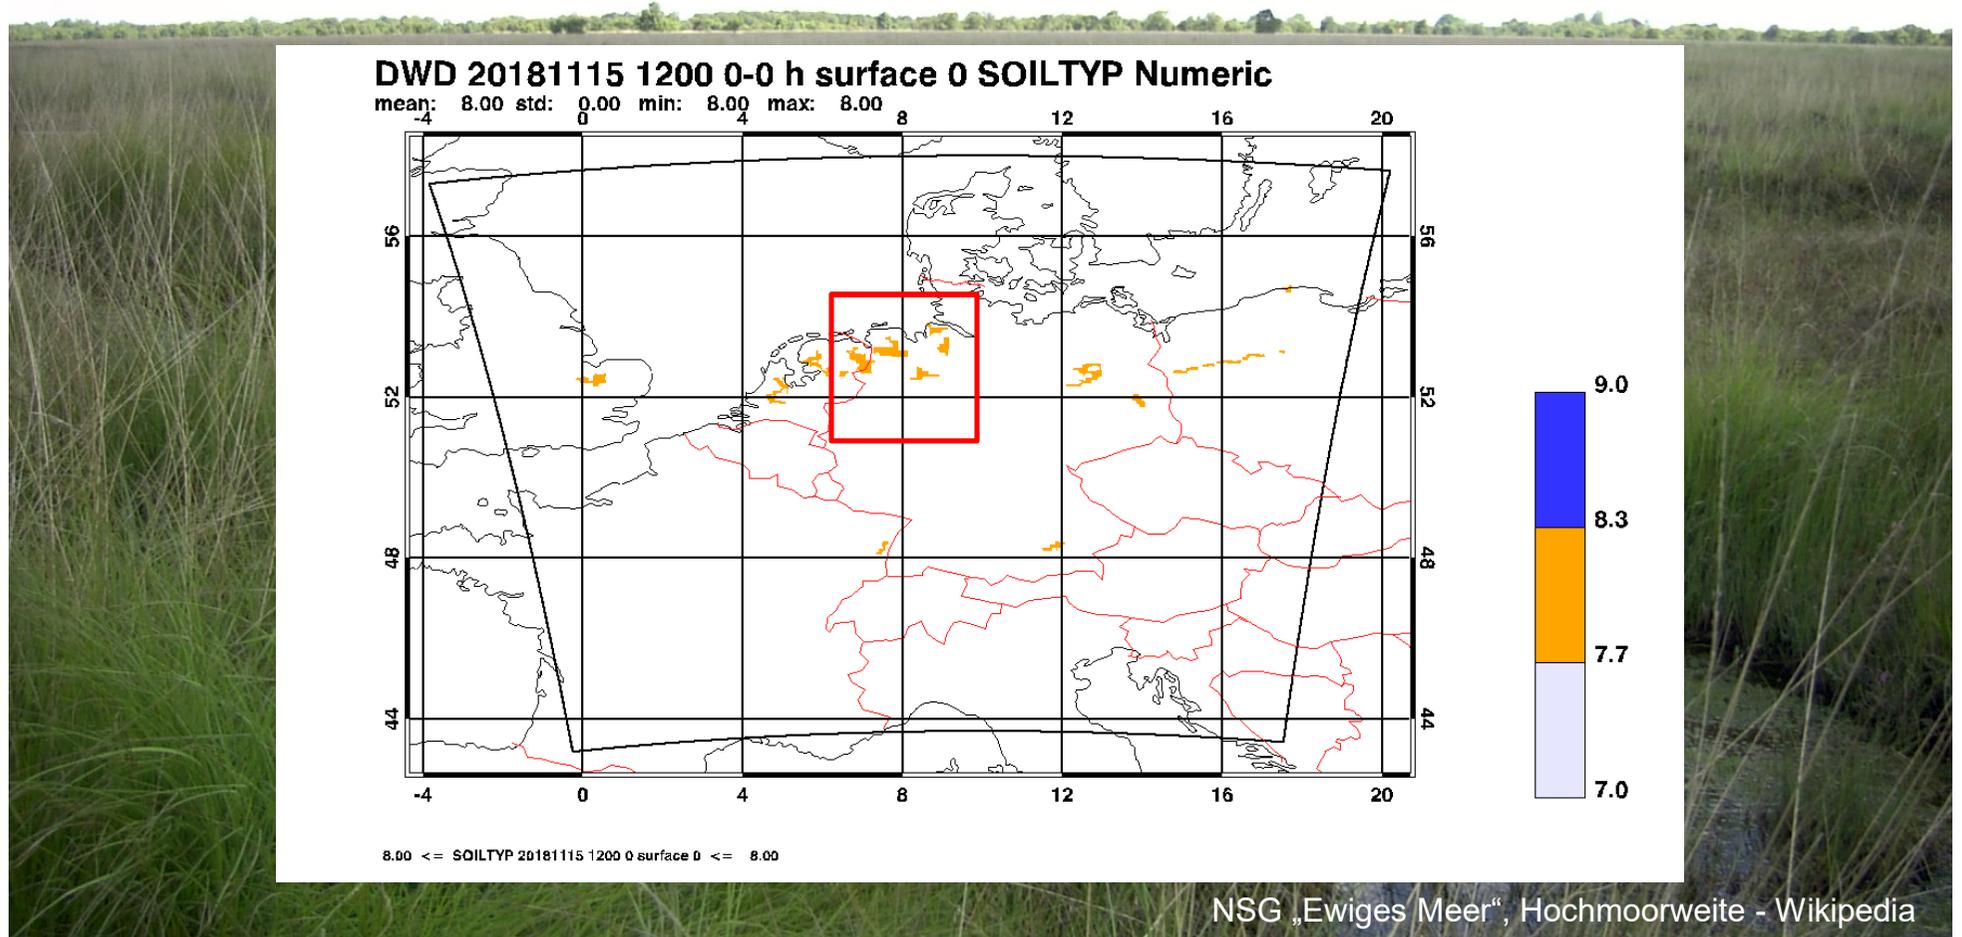

Trigger:

Overestimated sensible heat flux

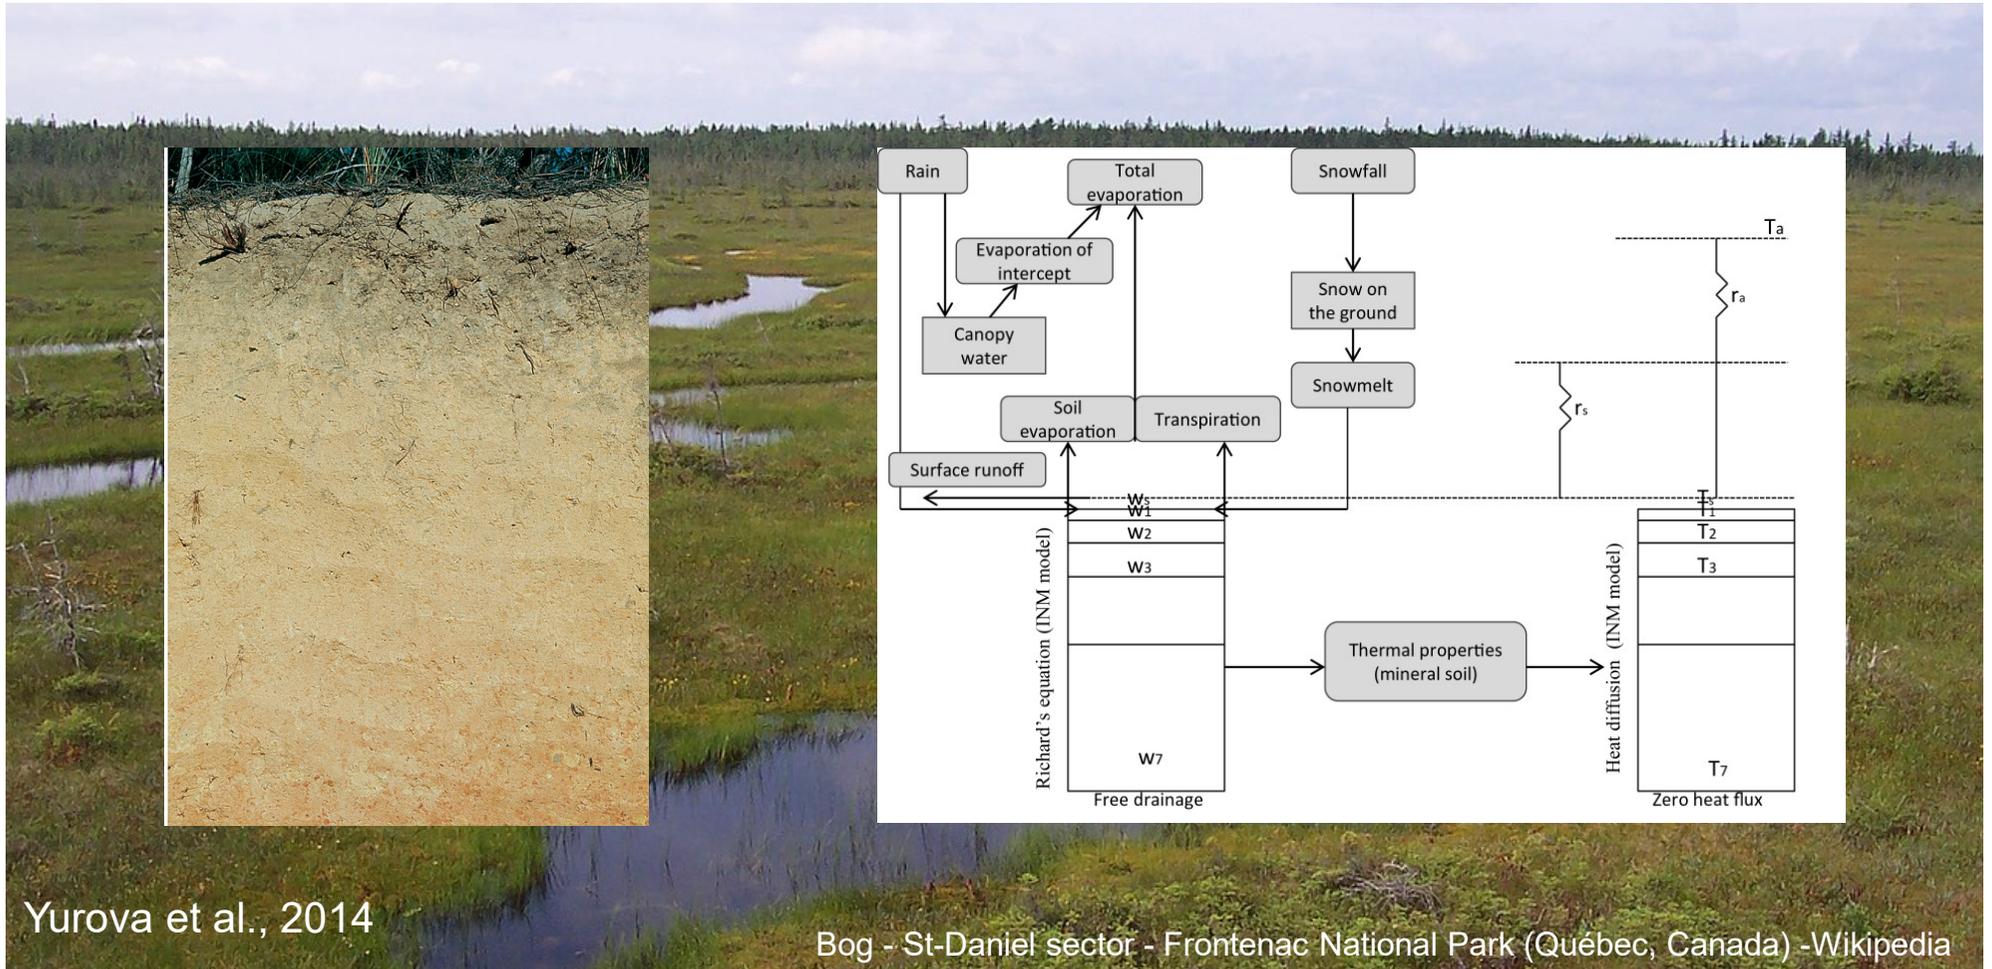

Underestimated latent heat flux

Proposal

- Mire parameterization developed in COSMO framework
- Contribution by Hydrometeorological Centre of Russia
- With version 5.06 COSMO now first op. NWP system considering peatlands in a special scheme
- Current limitations: fast but simple scheme: evapotranspiration, fixed water table, dry bogs are actually not captured
- However, experiment verification showed some positive impact from Mire parameterization in COSMO-D2
- Further tests in COSMO partner domains are ongoing (RHM)
- Will be further tested in ICON-(LAM) with adapted geospatial data

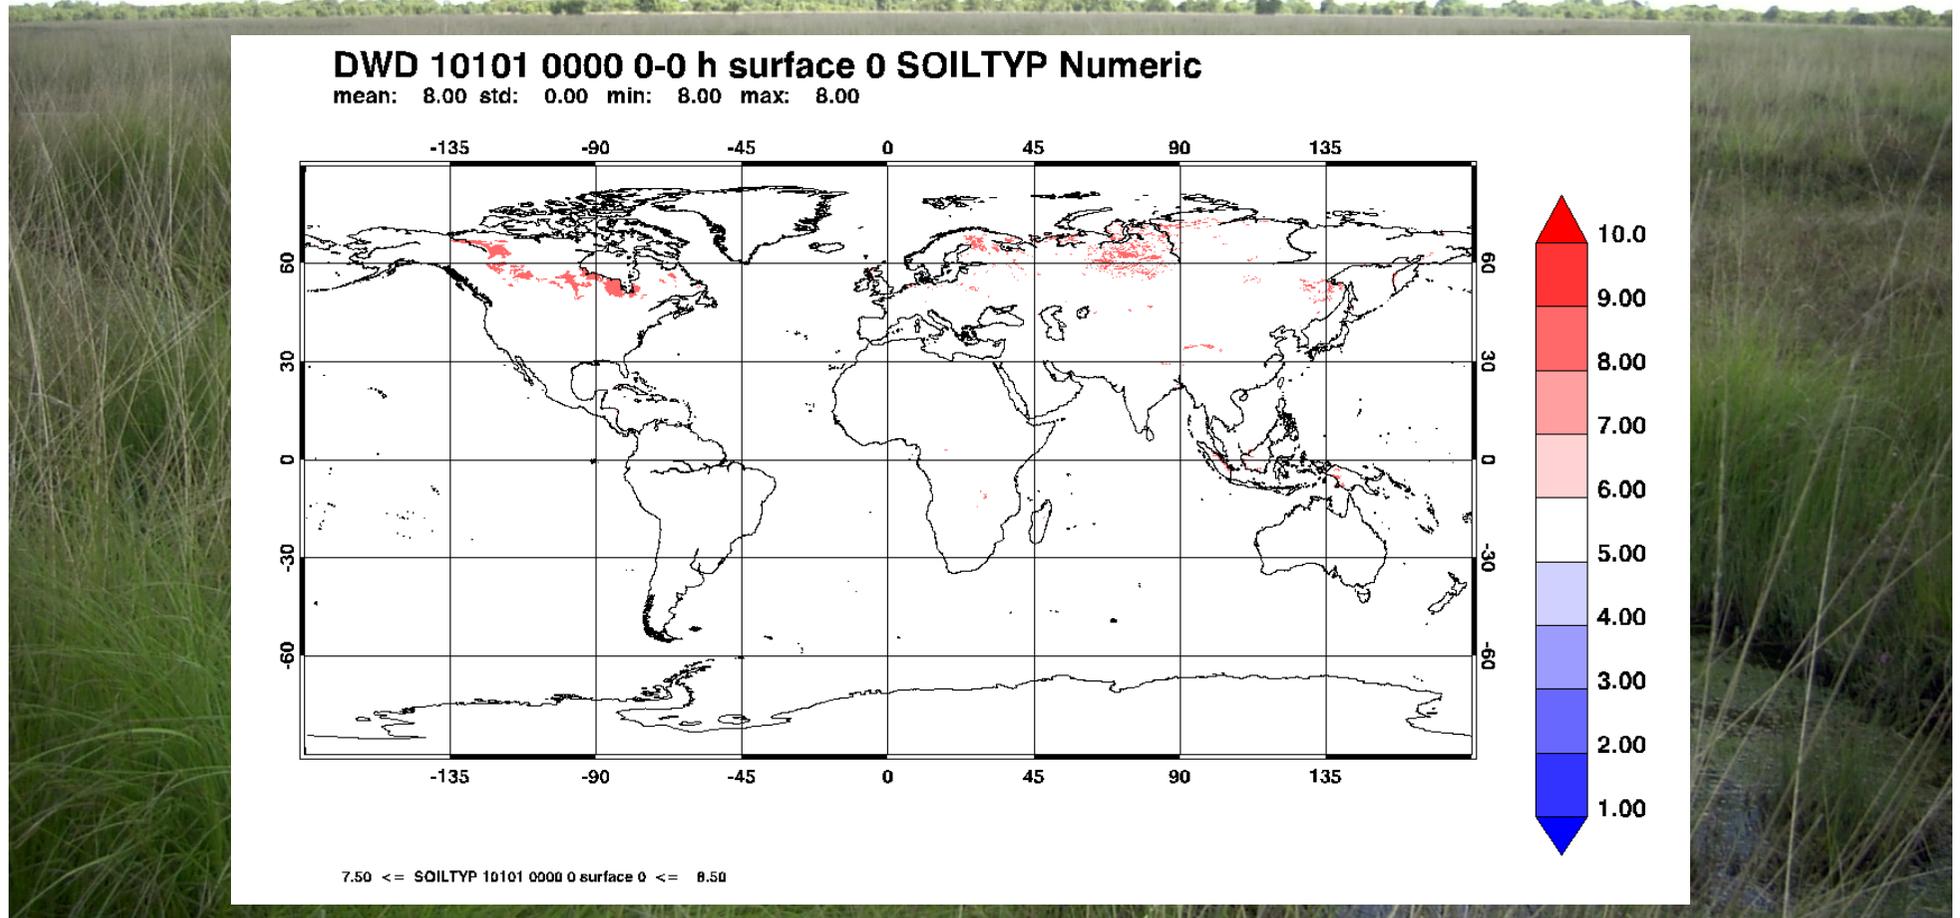

Outlook

Formerly peat bog, recultivated as a wetland near Sitniki, Russia - Wikipedia

Peatlands – ICON R03B07

Peatlands - Map

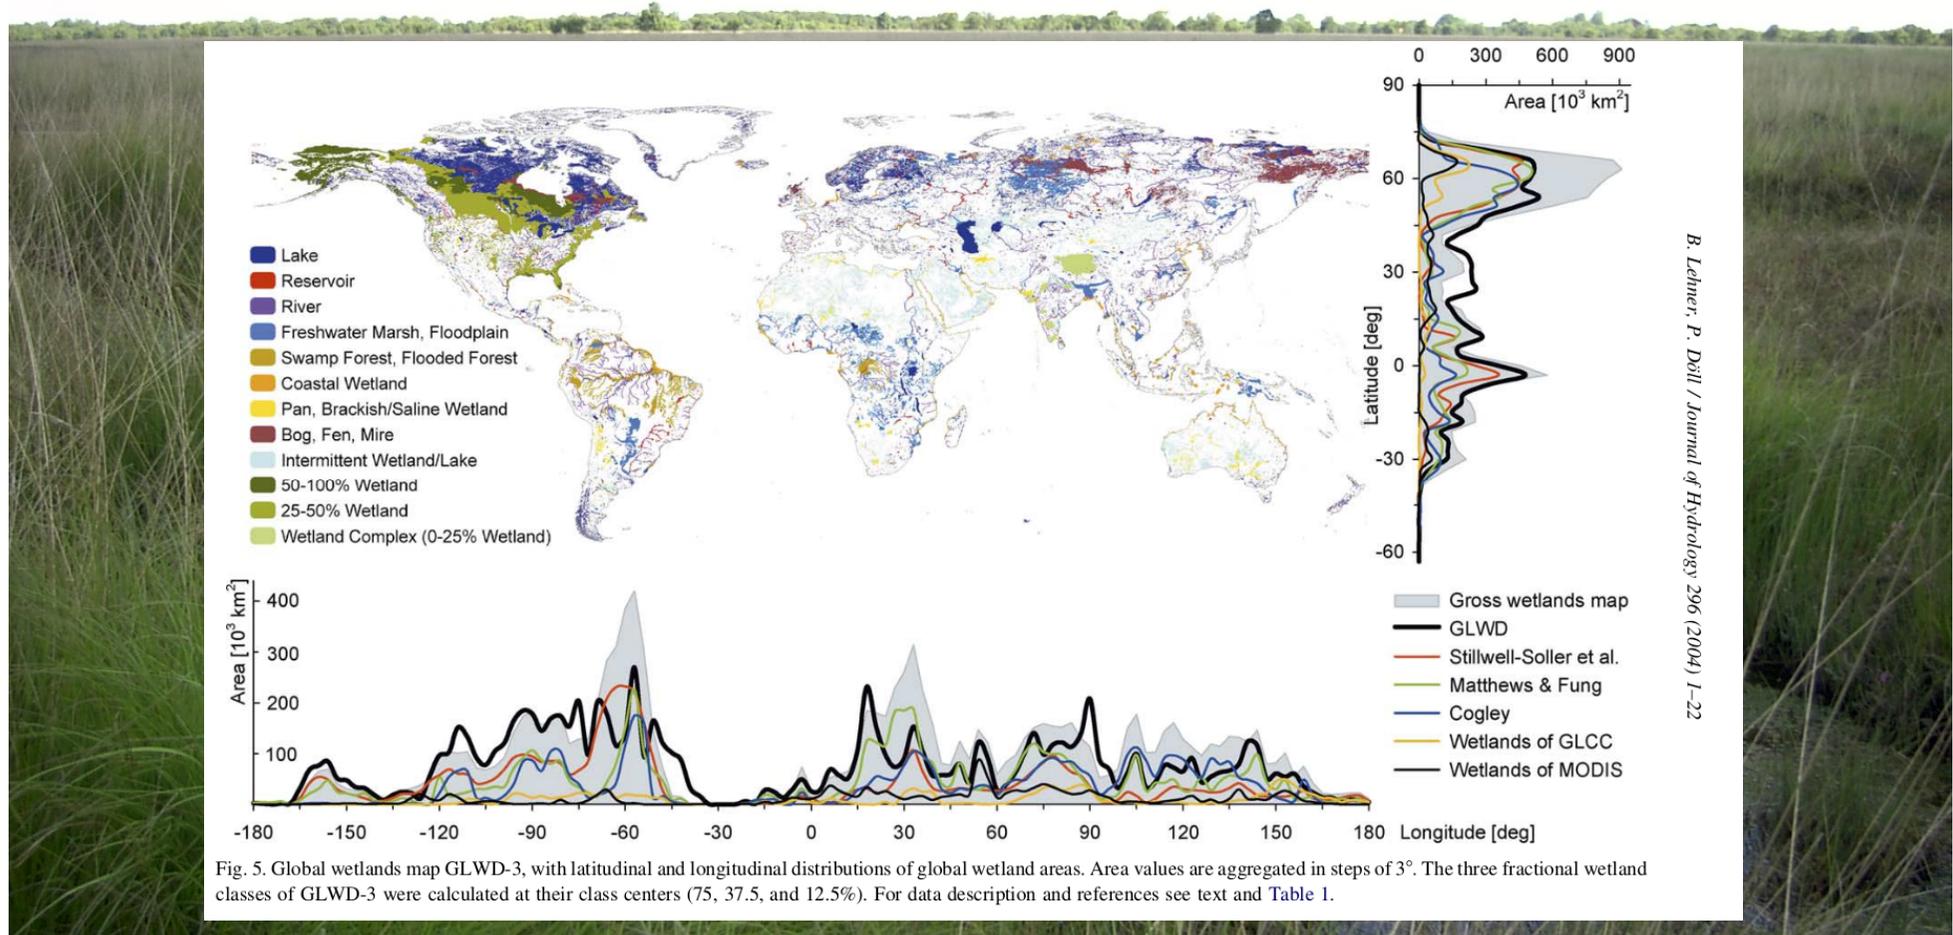

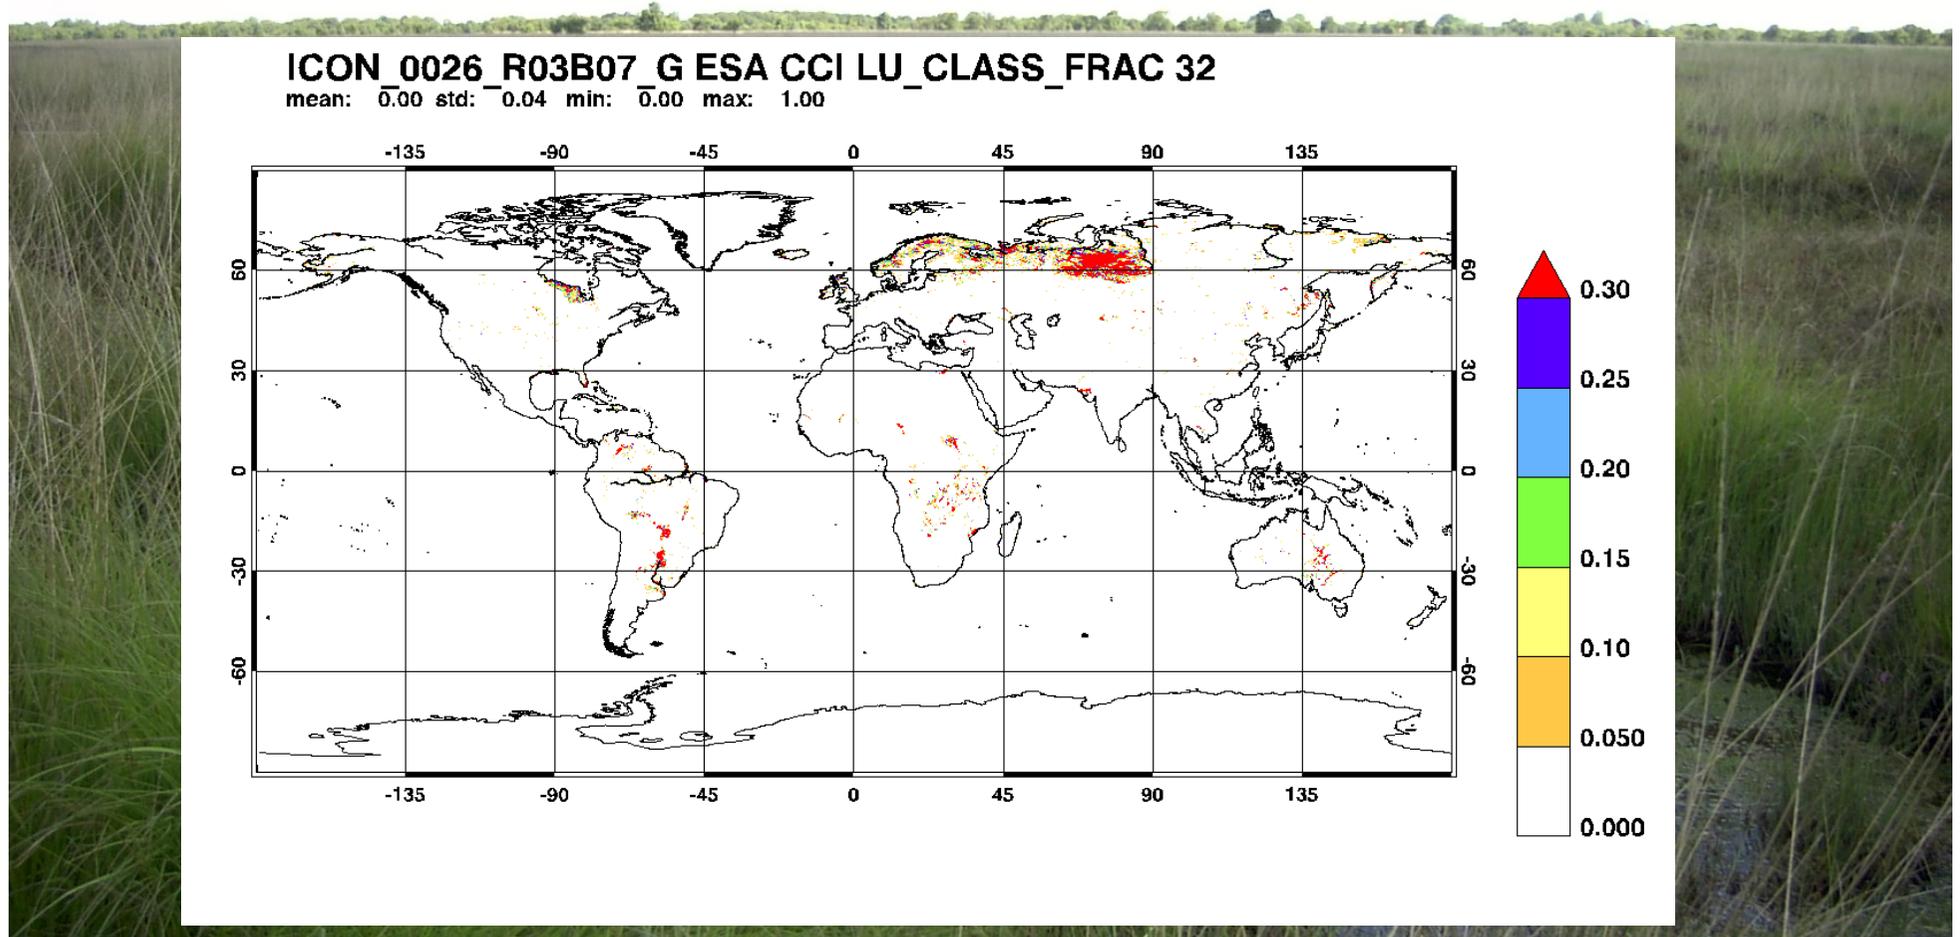

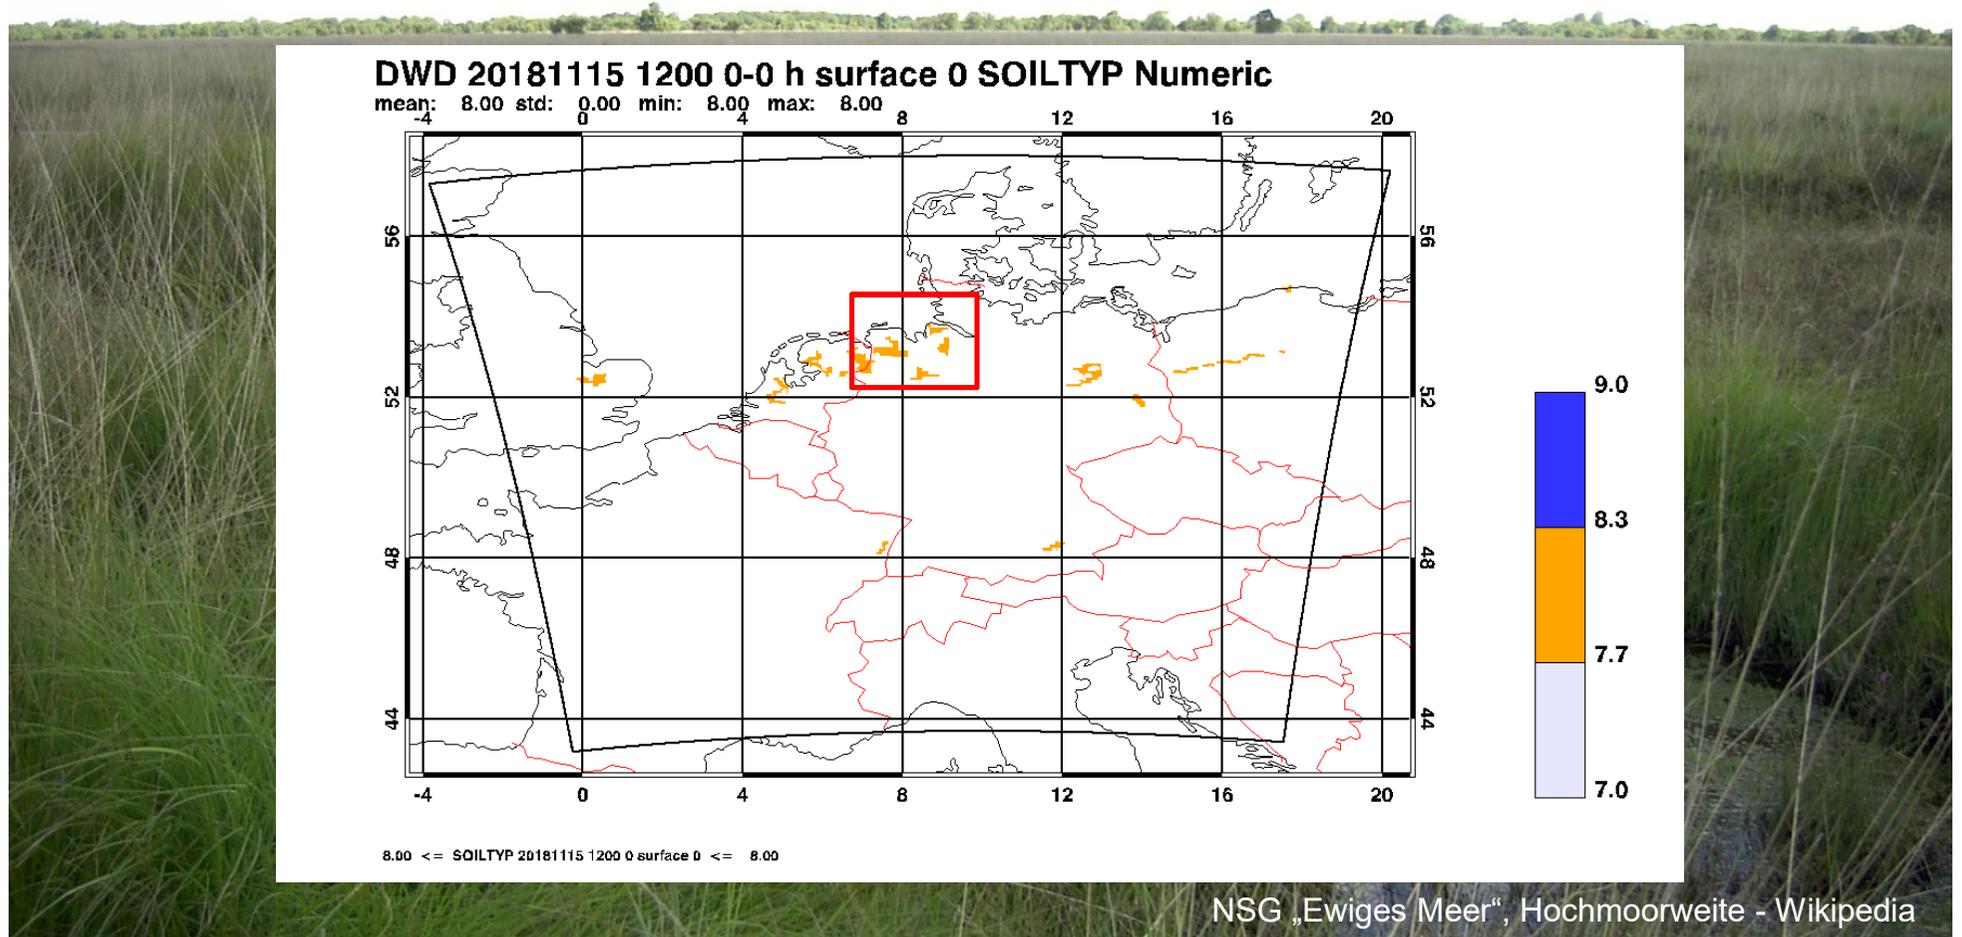

Fig. 5. Global wetlands map GLWD-3, with latitudinal and longitudinal distributions of global wetland areas. Area values are aggregated in steps of 3° . The three fractional wetland classes of GLWD-3 were calculated at their class centers (75, 37.5, and 12.5%). For data description and references see text and Table 1.
